

CSci 1302 Assignment 11

Due Friday, May 6th at any point in my office.

Problem 1 (10 points). Exercise 11 p. 267.

Problem 2 (2 points). Exercise 22 b,c p. 268.

Problem 3 (6 points). Exercises 28c, 29 b,d p. 268.

Problem 4 (20 points). Exercises 9, 13 (hint: use the Division by Cases rule - see p. 19), 14, 24, 29, 33 pp. 281-282.

Use the proof methods that we used in class, NOT the element argument given in the textbook.

Problem 5 (6 points). Exercises 17, 19, 22 p. 593.

Problem 6 (2 points). Exercises 4 p. 608.

Problem 7 (6 points). You are given three sets, $A = \{a, b, c\}$, $B = \{1, 2, 3\}$, and $C = \{red, white, blue\}$, and the following relations:

- $R \subseteq A \times B = \{(a, 1), (b, 1), (c, 3)\}$,
- $S \subseteq B \times C = \{(1, red), (2, blue), (3, red)\}$,
- $T \subseteq C \times A = \{(red, a), (white, c)\}$.

For each of the following operations compute the result if the operation makes sense, or, if it doesn't make sense, please explain why.

1. $R; S$
2. $S; T$
3. $R; R^{-1}$
4. $R^{-1}; R$
5. $R^{-1}; T^{-1}$
6. $R; T$

Problem 8 (5 points) You are given relation $R = \{(a, b), (b, c), (c, b), (d, c)\}$ on the universal set $U = \{a, b, c, d, e\}$. Please construct the following:

- the reflexive closure of R .

- the symmetric closure of R .
- the transitive closure of R .
- the “equivalence closure” of R (i.e. the smallest equivalence relation that contains R).

You may list pairs included in the resulting relations or draw the relations, each as a separate diagram.

That’s all, folks!
