## Mathematica quick reference

Items marked with should be mastered within the first two weeks of the semester.

## - Arithmetic

| Syntax | Read As | Example |
| :--- | :--- | :--- |
| $-,+, *, /$ | subtraction, addition, multiplication, division | $2 * \mathrm{x}-4 / \mathrm{x}$ |
| space | multiplication | k x is the same as $\mathrm{k} * \mathrm{x}$ |
| $\wedge$ | exponentiation | $2 \wedge 3$ |

Common error: forgetting the space in multiplication: kx does not equal k times x .

## -Brackets

| Syntax | Read As | Use | Example |
| :---: | :---: | :---: | :---: |
| [ ] | square brackets | enclosing arguments of functions | Sin [2.5] |
| ( ) | parentheses | grouping terms algebraically | $\left(3 x-x^{\wedge} 3\right)^{\wedge}(7 / 2)$ |
| \{ \} | curly braces | lists, ordered pairs | Plot[f[x], $\{\mathrm{x}, 0,2\}$ ] |

Common errors: missing parentheses in algebra: $x / 2+x$ is not the same as $x /(2+x)$ using parentheses for functions

## -Built-in Functions

| Function | Syntax | Function | Syntax | Function | Syntax |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\sin (x)$ | Sin $[\mathrm{x}]$ | $\cos (x)$ | $\operatorname{Cos}[\mathrm{x}]$ | $\tan (x)$ | $\operatorname{Tan}[\mathrm{x}]$ |
| $\arcsin (x)$ | $\operatorname{ArcSin}[\mathrm{x}]$ | $\arccos (x)$ | $\operatorname{ArcCos}[\mathrm{x}]$ | $\arctan (x)$ | $\operatorname{ArcTan}[\mathrm{x}]$ |
| $\ln (x)$ | $\log [\mathrm{x}]$ | $\log _{a}(x)$ | $\log [\mathrm{a}, \mathrm{x}]$ | $e^{x}$ | $\operatorname{Exp}[\mathrm{x}], \mathrm{E} \mathrm{x}$ |
| $\sqrt{x}$ | Sqrt $[\mathrm{x}], \mathrm{x}^{\wedge}(1 / 2)$ | $n!$ | $\mathrm{n}!$ | $\sqrt[3]{x}$ | CubeRoot $[\mathrm{x}]$ |
| $\sqrt[n]{(-x)}$ | Surd $[-\mathrm{x}, \mathrm{n}]$ |  |  | $x^{3 / 5}$ | Surd $\left[\mathrm{x}^{\wedge} 3,5\right]$ |

Common errors: capitalization. Mathematica is picky! All built-in functions begin with a capital letter. using exponentiation (e.g. $x^{3 / 5}$ ) for $n$th roots of negative numbers

## -Built-in Constants and Symbols

| Constant | $\pi$ | $e$ | $i$ | $\infty$ |
| :--- | :---: | :---: | :---: | :--- |
| Syntax | Pi, ESC p ESC | E | I | Infinity, ESC inf ESC |

Common error: using e instead of E , using I for $\infty$

## Keyboard Shortcuts

Raised exponents
Stacked fractions
Radical ( $\sqrt{ }$ )
List commands
Make Template
use Ctrl+^ (or Ctrl+6)
use Ctrl+/
use Ctrl+2
type the first three letters and Cmd +k (Mac) or Ctrl+k (PC) type full command name Cmd + Shift +k (Mac) or Ctrl+Shift+k (PC)

## Symbolic vs Numeric output

Mathematica works symbolically (algebraically) and gives exact answers unless instructed otherwise. Use a decimal in a number (eg, Pi/3.0 instead of $\mathrm{Pi} / 3$ ) or the $\mathrm{N}[$ ] command to get a decimal expansion. Use N [expr, n ] or SetPrecision [expr, n ] to display $n$ significant digits.

## Getting help

Use ?CommandName or the Documentation Center to get more information on specific commands.

## - Equal Signs

| Syntax | Read As | Use | Example |
| :--- | :--- | :--- | :--- |
| $=$ | set equal to | defining variables and some functions | $\mathrm{a}=3.2$ |
| $:=$ | set delayed | defining functions | $\mathrm{f}\left[\mathrm{x}_{-}\right]:=3 \mathrm{x}-7$ |
| $==$ | equal | equations | Solve $\left[\mathrm{x}^{\wedge} 2==3, \mathrm{x}\right]$ |

## -Solving Equations

| Syntax | Use | Example |
| :--- | :--- | :--- |
| Solve [ ] | solves equation(s) exactly using algebra | Solve $\left[\left\{x==3 \mathrm{y}-2, \mathrm{x}^{\wedge} 2+\mathrm{y}^{\wedge} 4==3\right\},\{\mathrm{x}, \mathrm{y}\}\right]$ |
| NSolve [ ] | decimal expansion of algebraic solution | NSolve $\left[\left\{\mathrm{x}==3 \mathrm{y}-2, \mathrm{x}^{\wedge} 2+\mathrm{y} \wedge 4==3\right\},\{\mathrm{x}, \mathrm{y}\}\right]$ |
| FindRoot [ ] | numerically approximates ONE solution <br> returns solution near $x=x_{0}$ | FindRoot $\left[\mathrm{x}^{\wedge} 2==3 \operatorname{Sin}[\mathrm{x}],\{\mathrm{x}, \mathrm{x} 0\}\right]$ |
|  |  |  |

$\begin{array}{ll}\text { Common errors: } & \text { Using }=\text { instead of }==. \text { May need to use Clear }[] \text { to recover. } \\ & \text { Warning: Some versions of Mathematica will reformat }==\text { as }=\text {, making this error hard to identify. } \\ & \text { Entering an interval instead of a single initial guess in FindRoot }[] .\end{array}$

## -Defining Your Own Functions

You tell Mathematica which variables are the independent variables using an underscore. Use := instead of $=$ to enable syntactic color-coding.

```
f[\mp@subsup{x}{-}{}]:=Sin[x^2+7x]+Cos[x] g[x, t_]:=E^x Sin[t]
```

## Plotting and Plot Options

| Plot type | Syntax |
| :---: | :---: |
| - plot $f(x)$ on interval $[a, b]$ | Plot[f[x], $\mathrm{x}, \mathrm{a}, \mathrm{b}\}$ ] |
| - plot $f(x)$ and $g(x)$ together | Plot [\{f [x], g[x] , \{x, a, b\}] |
| Implicit plot of $f(x, y)=0$ in $\mathbb{R}^{2}$ over $a \leq x \leq b$ and $c \leq y \leq d$ | ContourPlot[f[x,y]==0, \{x,a,b\}, \{y, c, d\}] |
| Parametric plot of $x=x(t), y=y(t)$ with $a \leq t \leq b$ | ParametricPlot[\{x[t],y[t]\}, t , $\mathrm{a}, \mathrm{b}\}$ ] |
| plotting list of data points | ListPlot [\{\{1,2\}, \{2, 3\}, \{3, 6\}\}, Joined->True] |
| Plotting in $\mathbb{R}^{3}$ | Plot3D[ ], ParametricPlot3D[ ], ContourPlot3D[ ] |
| Plot $f(x)$ with thick curve | Plot[f[x], \{x, -2, 5\}, PlotStyle->Thick] |
| Plot $f$ with displayed $y$-range to $3 \leq y \leq 7$ | Plot[f[x], \{x, -2,5\}, PlotRange->\{\{-2,5\}, \{3, 7\}\}] |
| shade between curve and axis | Plot[f[x], $\mathrm{x},-2,5\}$, Filling->Axis] |
| shade between two curves | Plot[\{f [x],g[x]\},\{x,-2,5\},Filling->\{1\}] |

## Working with Functions

| Mathematical Operation | usual notation | Syntax |
| :--- | :--- | :--- |
| evaluate a function | $f(3)$ | $\mathrm{f}[3]$ |
| differentiate | $\frac{d}{d x} f(x)$ or $f^{\prime}(x)$ | $\mathrm{D}[\mathrm{f}[\mathrm{x}], \mathrm{x}]$ or $\mathrm{f}^{\prime}[\mathrm{x}]$ |
| indefinite integral | $\int f(x) d x$ | Integrate $[\mathrm{f}[\mathrm{x}], \mathrm{x}]$ |
| definite integral (exact) | $\int_{a}^{b} f(x) d x$ | Integrate $[\mathrm{f}[\mathrm{x}],\{\mathrm{x}, \mathrm{a}, \mathrm{b}\}]$ |
| definite integral (approx) | $\int_{a}^{b} f(x) d x$ | NIntegrate $[\mathrm{f}[\mathrm{x}],\{\mathrm{x}, \mathrm{a}, \mathrm{b}\}]$ |

## Other Useful Commands

| Syntax | Use | Example |
| :---: | :---: | :---: |
| Simplify [ ] | attempts to simplify expression | Simplify [x (2-x) -3x+1] |
| Factor [ ] | attempts to factor expression | Factor $\left[x^{\wedge} 3+3 x^{\wedge} 2+3 x+1\right]$ |
| Expand [ ] | multiplies out (expands) | Expand [( $\left.\mathrm{x}-7)\left(\mathrm{x}^{\wedge} 2-11 \mathrm{x}-1\right)^{\wedge} 3\right]$ |
| Apart [ ] | partial fraction decomposition of $\frac{f(x)}{g(x)}$ | Apart $\left[(3 x-2)\left(x^{\wedge} 2-1\right)\right]$ |
| Eliminate[ ] | eliminate a variable from set of equations | Eliminate [ $\left.\left\{\mathrm{x}==\mathrm{t}^{\wedge} 2+1, \mathrm{y}==5 / \mathrm{t}\right\}, \mathrm{t}\right]$ |
| Reduce [ ] | symbolically solves equations giving conditions | Reduce [\{x+Cos [x*y] ==0\}, $\{\mathrm{x}, \mathrm{y}\}]$ ] |
